DAILY PRACTICE 27/10/2026	GS - II	Polity & Governance

MARKS	WORD LIMIT
10	~150 words

Answer Hint

Legislative efficiency; access to parliamentary information; citizen engagement; transparency and accountability; algorithmic bias; privacy and cybersecurity; human oversight; responsible AI governance

Model Answer

Introduction

Artificial Intelligence (AI) can support parliamentary democracy by improving access to information, streamlining legislative processes and creating new channels for citizen participation.

Potential benefits

1. Greater legislative efficiency: AI can assist in searching parliamentary records, summarising bills, translating documents and analysing committee reports, enabling members to process information more efficiently.

2. Enhanced citizen participation: AI-powered multilingual platforms can make parliamentary debates, legislative proposals and government information more accessible, encouraging informed public engagement.

3. Improved transparency: Searchable digital archives and automated information services can help citizens, researchers and civil society monitor parliamentary proceedings.

Key challenges

AI-generated errors, algorithmic bias, misinformation, data privacy risks and cyberattacks can undermine democratic trust. Unequal digital access may also exclude marginalised communities. AI must not replace parliamentary debate, independent judgment or constitutional accountability.

Way Forward

Parliament should establish clear standards for accuracy, transparency, privacy and cybersecurity. Human verification, regular audits, multilingual access and digital literacy are essential. AI systems should support—not substitute—elected representatives and established parliamentary procedures.

Conclusion

Responsible AI adoption can make parliamentary institutions more accessible, efficient and transparent while preserving democratic accountability and public trust.
