Answer Hint

Electricity Act 2003, State Electricity Regulatory Commissions, tariff determination, distribution companies, cross-subsidy, power sector reforms, consumer protection

Model Answer

Regulatory framework

Electricity distribution companies (DISCOMs) occupy the final link between power generation and consumers. Their financial health directly affects electricity supply reliability, infrastructure investment and the quality of consumer services.

The Electricity Act, 2003 provides for independent regulatory institutions, including State Electricity Regulatory Commissions (SERCs), to promote transparency and regulate electricity tariffs.

Balancing competing interests

1. **Consumer affordability:** Regulatory commissions examine tariff proposals and consider the interests of domestic, agricultural, commercial and industrial consumers.

2. **Financial viability:** Tariffs must allow efficient recovery of legitimate costs, including power procurement, transmission charges and distribution expenses.

3. **Cross-subsidisation:** Higher tariffs for certain consumer categories may support affordable electricity for economically weaker groups, although excessive cross-subsidy can affect industrial competitiveness.

4. **Efficiency incentives:** Performance-based regulation can encourage DISCOMs to reduce technical and commercial losses, improve billing and strengthen collection efficiency.

5. **Transparency:** Public hearings, regulatory orders and audited financial information improve accountability in tariff determination.

Persistent challenges

High aggregate technical and commercial losses, delayed subsidy payments, power procurement costs and political interference continue to affect DISCOM finances. At the same time, frequent tariff increases can burden households and small enterprises.

Way forward

Regulators should promote cost-reflective tariffs alongside targeted subsidies for vulnerable consumers. Smart metering, improved billing systems, timely government subsidy payments and transparent financial audits can strengthen distribution efficiency.

Conclusion: Independent regulation is essential for a financially sustainable and consumer-oriented electricity sector. Long-term affordability depends not simply on lower tariffs, but on efficient distribution, transparent pricing and reliable power supply.
